To run,

1. **cd** into the project root directory
2. In the terminal, run: **python wisar.py heatmap_1.txt** where heatmap_1.txt is the name of the datafile (and is present in the root)
3. The results will be generated in the results folder and will have a filename prefix ('heatmap_1' in this case)

Assumptions: Instructions for Ubuntu 16.04 LTS and python 3 but should run in most cases in other systems as well. Common libraries such as matplotlib, pandas, numpy and sys installed.
